👉 Your system **THINKS everything is wired**, but in reality:

- UI updated ✅
- Logic NOT connected ❌
- Context NOT triggering re-render ❌
- Navigation NOT hooked ❌

Even your logs say:

"All is wired up correctly"

👉 That's WRONG.

💣 ROOT CAUSE (REAL)

From your Replit logs + screenshots:

❌ 1. Language not updating

Means:

- Context exists BUT components are NOT using it
- OR translations not re-rendering

❌ 2. Discover still shows search bar

Means:

- You edited wrong file OR wrong screen rendered
- OR navigation stack not refreshed

❌ 3. Search / History not working

Means:

- Icons NOT implemented in header
- Navigation NOT linked

🚨 MOST IMPORTANT CLUE

This line from your logs:

“Everything looks correct… restart mobile app”

👉 This is the issue.

Your system is:
❌ Checking code
❌ NOT verifying UI binding

💣 FINAL FIX PROMPT (FORCE REAL IMPLEMENTATION)

Use this EXACT prompt 👇 (this one fixes your REAL problem, not theory)

You are a senior React Native Expo engineer.

STOP assuming the app is correct.

You MUST DEBUG and FIX why changes are NOT reflecting in UI.

🚨 CRITICAL BUG

UI changes are NOT appearing in the app.

This means:

- Wrong component is rendered
- Context is not used
- Navigation stack is incorrect
- State updates are not triggering re-render

🔍 STEP 1 — VERIFY ACTIVE SCREEN (MANDATORY)

Find which file is actually rendered for:

- Discover screen
- Settings screen
- Report screen

Add:

```
console.log("DISCOVER SCREEN ACTIVE")
console.log("SETTINGS SCREEN ACTIVE")
```

If logs DO NOT appear:
👉 You are editing the WRONG FILE

🔥 STEP 2 — FORCE DISCOVER HEADER FIX

In the ACTIVE Discover screen:

REMOVE:

- Search input bar
- Filter chips (All, Gym, Cardio...)

ADD:

Top-right header icons:

Row:
[🔍 Search] [🕒 History]

Implementation:

```
<TouchableOpacity onPress={() => router.push("/search")} />
<TouchableOpacity onPress={() => router.push("/report")} />
```

🔥 STEP 3 — FORCE SEARCH SCREEN NAVIGATION

Create:

/app/search.tsx

Verify navigation works:

Click search icon → MUST open search screen

If not:
👉 Fix router config

🔥 STEP 4 — FIX LANGUAGE (REAL BUG)

Problem: UI not re-rendering

Fix:

1. Wrap app with LanguageProvider in root layout

/app/_layout.tsx:

---

2. In EVERY screen:

Replace hardcoded text:

❌ "Settings"
❌ "Discover"

WITH:

```
const { t } = useLanguage()
```

```
{t("settings")}
```

---

3. When language changes:

```
setLanguage(lang)
```

AND verify:

```
console.log("LANG UPDATED:", lang)
```

🔥 **STEP 5 — FORCE RE-RENDER TEST**

Inside any screen:

```
const { language } = useLanguage()

useEffect(() => {
console.log("LANG CHANGED:", language)
}, [language])
```

If this DOES NOT log:
👉 Context is broken

🔥 **STEP 6 — CLEAR CACHE (IMPORTANT)**

Run:

```
npx expo start -c
```

🔥 STEP 7 — VERIFY NAVIGATION STRUCTURE

Check:

/app/
(tabs)/
discover.tsx
report.tsx
settings.tsx

If using tabs:

👉 Make sure discover.tsx is the one being edited

🔥 STEP 8 — FORCE VISUAL TEST

Add temporary UI:

<Text style={{color:"red"}}>TEST UPDATED UI

If this DOES NOT show:
👉 Wrong file is being edited

🔥 STEP 9 — REMOVE DUPLICATE SCREENS

Search project for:

"Discover"

If multiple files exist:
👉 You are editing wrong one

🎯 FINAL RESULT REQUIRED

After fix:

✅ Search bar removed
✅ Icons visible in top right
✅ Search opens new screen
✅ History opens report
✅ Language changes entire app
✅ Logs confirm re-render

⚠️ **RULE**

Do NOT say “everything is correct”

You must PROVE:

- Logs working
- Navigation working
- UI updated

Fix root cause, not UI.
