

🔥 Perfect. Now we enter the **MOST IMPORTANT** phase for user experience.

Until now:

- Phase 1 → System fixed ✅
- Phase 2 → Workout engine built ✅

👉 But your app still lacks **REAL FEEL**

🚀 PHASE 3: WORKOUT EXPERIENCE (PLAYER + LIVE DEMO)

👉 This is where your app becomes:

🌟 **"WOW this feels like a real fitness app"**

🧠 PHASE 3 OBJECTIVE

Convert your app from:

❌ List of exercises

✅ **Interactive guided workout experience**

🔧 WHAT YOU WILL BUILD

After this phase:

- ✅ Animated exercise demo (like your reference app)
 - ✅ Timer-based workout player
 - ✅ Auto next exercise
 - ✅ Rest system
 - ✅ Voice coach (basic)
 - ✅ Continue workout system
-

⚙️ PHASE 3 STRUCTURE

🟪 SPRINT 3.1 — Workout Player Engine

👉 Timer + flow

🟣 SPRINT 3.2 — Live Exercise Demo

👉 Animated human (Lottie/GIF)

🟣 SPRINT 3.3 — UX Enhancements

👉 Pause / Resume / Skip / Continue

🟣 FINAL REPLIT PROMPT (PHASE 3 COMPLETE)

Paste this EXACTLY 👉

You are a senior React Native fitness app engineer.

You must COMPLETE PHASE 3:

Build a real workout player system with live exercise demo and full workout flow.

⚠️ This is NOT UI only.

⚠️ This must feel like a real guided workout app.

🎯 OBJECTIVES

1. Build workout player engine
 2. Add timer system
 3. Add animated exercise demo
 4. Add rest system
 5. Add controls (pause/skip)
 6. Add resume workout system
-

🔥 STEP 1 — CREATE WORKOUT PLAYER SCREEN

Create:

/app/workout/player.tsx

This screen must:

- Take generated workout as input
 - Show one exercise at a time
 - Track current index
-

STEP 2 — STATE MANAGEMENT

Use:

useState:

- currentExerciseIndex
 - timeRemaining
 - isPaused
-

STEP 3 — TIMER SYSTEM

Use:

setInterval (1 sec)

Logic:

- Countdown time
 - When 0 → move to next exercise
 - When last → finish workout
-

STEP 4 — REST SYSTEM

Between exercises:

- Add 10–20 sec rest
 - Show "Rest" screen
 - Then auto next exercise
-

🔥 STEP 5 — LIVE EXERCISE DEMO

Create:

/components/ExercisePlayer.js

Use:

Option 1 (FAST):

- GIF images

Option 2 (BEST):

- Lottie animations

Install:

npm install lottie-react-native

Display:

- Animated exercise
 - Exercise name
 - Reps / time
-

🔥 STEP 6 — CONTROLS

Add buttons:

- Pause / Resume
 - Skip
 - Previous
-

🔥 STEP 7 — WORKOUT SUMMARY SCREEN

After completion:

Show:

- Total exercises

- Total time
- Calories burned

Call:

addWorkout() (Phase 1)

🔥 STEP 8 — CONTINUE WORKOUT SYSTEM

Save progress:

- current exercise index
- remaining time

Store in AsyncStorage

On app open:

If workout exists:

👉 Show "Continue Workout" card

🔥 STEP 9 — BASIC VOICE COACH

Install:

expo install expo-speech

Trigger:

- At start
- Between exercises

Example:

"Keep your back straight"

🔥 STEP 10 — UI REQUIREMENTS

Screen must look like:

- Big animation center
 - Timer circle
 - Exercise name bold
 - Controls at bottom
-

TEST CASES

1. Start workout → timer runs
 2. Timer ends → next exercise
 3. Pause → stops timer
 4. Resume → continues
 5. Skip → next exercise
 6. Finish → summary screen
 7. Restart app → resume works
-

FINAL RESULT

After implementation:

- ✓ Real workout experience
 - ✓ Live exercise demo
 - ✓ Smooth transitions
 - ✓ Resume system works
 - ✓ Feels like premium fitness app
-

RULE

DO NOT:

- Show static list
- Skip animation

- Skip timer logic

Make it interactive.

WHAT YOU JUST UNLOCKED

After Phase 3:

 Your app becomes:

 **Real usable fitness product**

Not just UI

Not just logic

But **experience**
