

You are a senior React Native Expo engineer.

You must COMPLETE PHASE 1 (System Stabilization) of the FitAI app.

⚠️ This is NOT a UI update.

⚠️ This is a CORE SYSTEM FIX.

CRITICAL RULES

DO NOT:

- Assume code is working
- Only modify UI
- Use static/mock data

YOU MUST:

- Debug actual rendering
 - Fix state + navigation
 - Ensure persistence works
-

PHASE 1 OBJECTIVES

1. Fix wrong screen rendering (UI not updating issue)
 2. Implement global state (AppContext)
 3. Enable AsyncStorage persistence
 4. Fix Settings (language must update entire app)
 5. Fix Discover (remove search bar → add icons)
 6. Implement Search + History navigation
 7. Fix Report (use real stored data)
-

STEP 1 — VERIFY ACTIVE SCREENS (MANDATORY)

Add console logs:

```
console.log("DISCOVER ACTIVE")
console.log("SETTINGS ACTIVE")
console.log("REPORT ACTIVE")
```

If logs DO NOT appear:

👉 You are editing wrong files → FIX routing

🔥 STEP 2 — FIX NAVIGATION STRUCTURE

Ensure correct structure:

```
/app
/(tabs)
training.tsx
discover.tsx
report.tsx
settings.tsx
/search.tsx
```

Fix router so:

Discover → Search

Discover → Report

🔥 STEP 3 — CREATE GLOBAL STATE (AppContext)

Create:

```
/context/AppContext.js
```

State:

```
{
  language: "en",
  workouts: [],
  totalCalories: 0,
  totalMinutes: 0,
  totalWorkouts: 0
}
```

Functions:

- setLanguage(lang)
- addWorkout(workout)

- loadData()
- saveData()

Wrap app:

/app/_layout.tsx

STEP 4 — ADD ASYNC STORAGE

Install if missing:

expo install @react-native-async-storage/async-storage

Implement:

loadData() → load workouts + language

saveData() → save state on update

STEP 5 — FIX SETTINGS SCREEN (LANGUAGE)

When user changes language:

setLanguage(lang)

Also:

saveData()

VERIFY:

Add log:

console.log("LANGUAGE UPDATED:", lang)

STEP 6 — FORCE UI TO USE STATE

In ALL screens:

const { language } = useApp()

Add:

```
useEffect(() => {  
  console.log("LANG CHANGED:", language)  
}, [language])
```

If NOT triggered → FIX context

🔥 STEP 7 — FIX DISCOVER SCREEN

REMOVE:

- Search bar
- Filter chips (All, Gym, etc.)

ADD HEADER ICONS:

Row right side:

[🔍 Search] [🕒 History]

Code:

```
onPress → router.push("/search")  
onPress → router.push("/report")
```

🔥 STEP 8 — CREATE SEARCH SCREEN

/app/search.tsx

Must include:

- Search input
- Cancel button
- Body focus (image + label)

Typing:

Filter exercises based on keyword

🔥 STEP 9 — FIX REPORT SCREEN

REMOVE static data.

USE:

```
const { workouts } = useApp()
```

Compute:

```
totalWorkouts = workouts.length
```

```
totalCalories = sum(calories)
```

```
totalMinutes = sum(duration)
```

DISPLAY:

Top row:

Workouts | Calories | Minutes

HISTORY LIST:

Each item:

- name
 - date
 - duration
 - calories
-

STEP 10 — SAVE WORKOUT

When workout completes:

```
addWorkout({  
  id: Date.now(),  
  date: new Date(),  
  muscle: "chest",  
  duration: 15,  
  calories: 120  
})
```

VERIFY:

After saving:

- Report updates
- History appears

- Data persists after restart
-

STEP 11 — CLEAR CACHE (IMPORTANT)

Run:

```
npx expo start -c
```

FINAL TEST CHECKLIST

You MUST verify:

1. Changing language logs update + UI changes
 2. Discover screen shows icons (NOT search bar)
 3. Clicking search → opens search screen
 4. Clicking history → opens report
 5. Completing workout → appears in report
 6. Restart app → data still exists
-

DEFINITION OF DONE

PHASE 1 is COMPLETE only if:

- ✓ UI reflects state changes
 - ✓ Data persists
 - ✓ Navigation works
 - ✓ No static data remains
-

Fix root issues. Do not stop at UI changes.
