🚨 🔍 DEEP ISSUE IN YOUR CURRENT DISCOVER FLOW

❌ What is happening now:

From your screenshot:

- You click **“7-Minute Abs”**
- A **modal opens** (just UI)
- It shows info
- Then tells user:

“Go to Training tab to start workout”

👉 This is a **dead-end UX**

❌ Why this is BAD (Product Thinking)

1. ❌ User loses context
2. ❌ Extra navigation friction
3. ❌ No direct action
4. ❌ Feels fake / scripted
5. ❌ No engagement loop

👉 This is exactly why your app feels "not alive"

🧠 WHAT SHOULD HAPPEN (REAL UX)

✅ Correct Flow (Industry Level)

User taps workout card:

👉 Instead of modal → **navigate to Workout Detail Screen**

🔥 NEW FLOW

Discover → Workout Detail → Start → Live Session

✅ Screen 1: Workout Detail Page

NOT a modal ❌
FULL SCREEN PAGE ✅

Must include:

- Workout name
- Description
- Total duration
- Number of exercises
- Level
- Exercise list preview

And MOST IMPORTANT:

👉 BIG BUTTON:

🔥 Start Workout

✅ Screen 2: Workout Session

Immediately starts:

1. 5 sec countdown
2. 📢 Whistle sound
3. Exercise animation
4. Timer
5. Next exercise loop

🔥 YOUR CURRENT PROBLEM SUMMED UP

Feature	Current	Required
Card click	Modal ❌	Navigation ✅
Start action	Missing ❌	Direct CTA ✅
Exercise list	Hidden ❌	Visible ✅
Session start	Not connected ❌	Real flow ✅

⚠️ ROOT CAUSE (VERY IMPORTANT)

Your code likely has:

onClick={() => setSelectedWorkout(workout)}

👉 This only opens modal

Instead you need:

router.push(`/workout/${workout.id}`)

🚀 FINAL REPLIT AI PROMPT (DISCOVER FIX)

Use this EXACT 👇

📄 PROMPT

Act as a senior React Native + Next.js engineer.

Fix the Discover screen so workouts actually start and are not just static modals.

PROBLEM:

Currently, when a user clicks a workout card (like "7-Minute Abs"), a modal opens with information but no real action.

This makes the app feel fake and non-functional.

REQUIRED FIX:

---

1. REMOVE MODAL BEHAVIOR:

- Delete the modal-based workout preview system
- Replace it with real navigation

---

2. ADD WORKOUT DETAIL PAGE:

Create a new screen:

/workout/[id]

This page must show:

- Workout title
- Description
- Duration
- Level
- Total exercises
- Full list of exercises

Each exercise should show:

- name
- duration or reps
- type

---

3. ADD START WORKOUT BUTTON:

At the bottom:

[Start Workout]

This must navigate to:

/workout/session/[id]

---

4. CONNECT TO WORKOUT SESSION:

When user clicks "Start Workout":

- Pass workout data
- Start 5-second countdown
- Then begin session

---

5. UPDATE DISCOVER SCREEN:

Replace:

onClick → open modal

With:

onClick → router.push(`/workout/${workout.id}`)

---

6. MAKE SEARCH WORK:

- Filter workouts dynamically
- Use:
  title
  description
  category

---

7. OPTIONAL (BUT IMPORTANT UX):

- Add loading state while navigating
- Add smooth transition animation

GOAL:

User should be able to:

Discover → Click workout → View details → Start → Workout session runs

No dead ends. No fake UI.

Make the app feel like a real fitness product.

🧠 **FINAL TRUTH**

👉 Right now your app = **Dribbble design clone**

👉 After this fix → it becomes:

🔥 **Interactive Fitness System**
